Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Amendment 9 to ISO/IEC 14496-3:2005 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 29, *Coding of audio, picture, multimedia and hypermedia information*.

Information technology — Coding of audio-visual objects

Part 3:
Audio

AMENDMENT 9: Enhanced low delay AAC

In the following, changes in existing text and tables are highlighted by grey background.

In 1.5.1.1, extend Table 1.1 with the following entries:

Table 1.1 — Audio Object Type definition based on Tools/Modules

Object Type ID	Audio Object Type	gain control	block switching	window shapes - standard	window shapes – AAC LD	Low Delay Window	filterbank - standard	filterbank - SSR	TNS	LTP	intensity	coupling	frequency deomain prediction	PNS	MS	SVQ	FSS	upsampling filter tool	quantisation&coding - AAC	quantisation&coding - TwinVQ	quantisation&coding - BSAC	AAC ER Tools	ER payload syntax	EP Tool 1)	CELP	Silence Compression	HVXC	HVXC 4kbit/s VR	SA tools	SASBF	MIDI	HILN	TTSI	SBR	Layer-1	Layer-2	Layer-3	SSC (Transient, Sinusoid, Noise)	Parametric stereo	Low Delay SBR	Remark
	…																																								
39	ER AAC ELD					X	X		X		X			X	X				X			X	X	X																X	
40-95	(reserv-ed)																																								

Before 1.5.2, add 1.5.1.2.37:

1.5.1.2.37 Error Resilient (ER) AAC ELD object type

The enhanced low delay AAC object type (ER AAC ELD) is identical to the ER AAC LD object type, plus the utilization of a Low Delay Filterbank (LDFB) and an enhanced low delay window. It also permits combinations with the PNS tool as well as the Low Delay SBR tool. The ER AAC ELD object type provides the ability to extend the usage of generic low bitrate audio coding to applications requiring a very low delay of the encoding / decoding chain (e.g. full-duplex real-time communications).”

In 1.5.2.4, insert the following new entries for the Baseline MPEG Surround Profile into Table 1.12 audioProfileLevelIndication and adapt the “reserved for ISO use” range accordingly (changes are highlighted in gray):

Value	Profile	Level
…	…	…
0x33	High Efficiency AAC v2 Profile	L5
0x34	Low Delay AAC Profile	L1
0x35	Baseline MPEG Surround Profile (see ISO/IEC 23003-1)	L1
0x36	Baseline MPEG Surround Profile (see ISO/IEC 23003-1)	L2
0x37	Baseline MPEG Surround Profile (see ISO/IEC 23003-1)	L3
0x38	Baseline MPEG Surround Profile (see ISO/IEC 23003-1)	L4
0x39	Baseline MPEG Surround Profile (see ISO/IEC 23003-1)	L5
0x3A	Baseline MPEG Surround Profile (see ISO/IEC 23003-1)	L6
0x3B - 0x7F	reserved for ISO use	-
0x80 - 0xFD	user private	-
0xFE	no audio profile specified	-
0xFF	no audio capability required	-
NOTE — Usage of the value 0xFE indicates that the content described by this InitialObjectDescriptor does not comply to any audio profile specified in ISO/IEC 14496-3. Usage of the value 0xFF indicates that none of the audio profile capabilities are required for this content.

The top level payload for ER AAC ELD is defined in er_raw_data_block_eld(). All definitions mentioned in subclause 1.6.2.2.2.3 are also valid for this AOT.

At the end of 1.6.5.1, add a sentence:

"NOTE: None of these signaling methods described in this subclause is allowed for AAC ELD in order to signal the low delay sbr tool. For this case the ldSbrPresentFlag in the ELDSpecificConfig is to be used"

After 4.6.18, add a new subclause with the title "Low Delay SBR":

4.6.19 Low Delay SBR

4.6.19.1 Introduction

Low Delay SBR is derived from the standard SBR tool in order to be utilized as a bandwidth extension coder in communication scenarios. Thus, the algorithmic delay of this tool is minimized to achieve an overall delay low enough for bi-directional communication applications.

Summary of modifications:

- Frame length adopted to a core codec with 512 or 480 samples per frame
- Frame-locked time/frequency grid
- Minimization of delay in QMF buffer
- Utilizing a Complex Low Delay Filterbank

The low delay SBR tool is defined by the following modifications with respect to the standard algorithm (i.e. SBR audio object type). All clauses/subclauses can be found in the brackets after each headline.

4.6.19.2 Definitions, Constants and Variables

4.6.19.2.1 Definitions (changes to 4.6.18.2.1.20)

- **time slot**: finest resolution in time for SBR envelopes and noise floors. One time slot equals one subsample in the QMF domain.

4.6.19.2.2 Constants (changes to 4.6.18.2.5)

- **RATE:** For core codec AAC ELD the constant $RATE = 1$ should be used instead of $RATE = 2$.

4.6.19.2.3 Variables (changes to 4.6.18.2.6)

- **numTimeSlots:** The number of time slots for core codec AAC ELD is $numTimeSlots = 16$, for 512 AAC frame and $numTimeSlots = 15$, for 480 AAC frame.

- t_{HFGen}: Due to the removed additional delay the offset of the HF-generation module is set to $t_{HFGen} = 2$. The following Figure Figure AMD9.2 explains the offsets for core codec AAC ELD correctly.

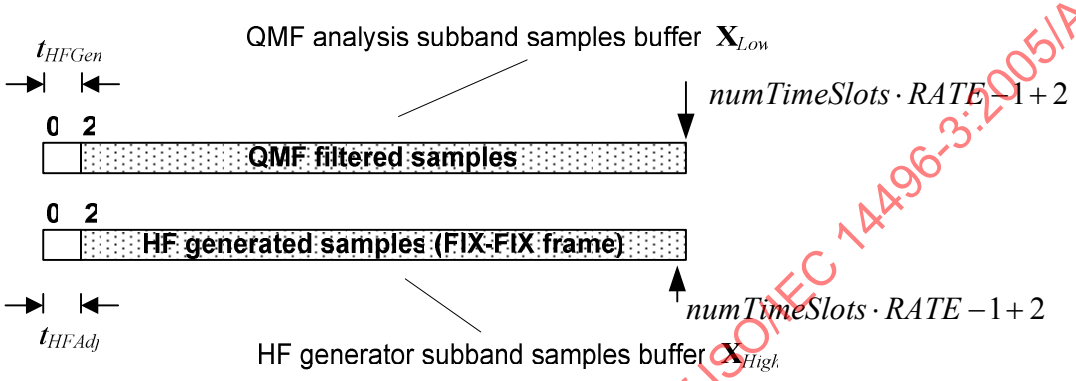

Figure AMD9.2 — Synchronization for low delay SBR

4.6.19.2.4 Inverse Filtering (changes to 4.6.18.6.2)

Due to the modified buffer management the calculation of the covariance matrix has to be changed as follows: The upper limit of n is to be changed from $numTimeSlots \cdot RATE + 6 - 1$ to $numTimeSlots \cdot RATE - 1$.

4.6.19.3 Time-Locked frequency grid

The time/frequency grid for the Low Delay SBR is specified in the following subclauses.

4.6.19.3.1 FrameClasses

Low Delay SBR uses a reduced set of frame classes which are listed in the Table below:

Table AMD9.9 — bs_frame_class

4.6.19.3.2 sbr_ld_grid()

Low Delay SBR uses a different syntax to signal the grid data. The standard sbr_grid() syntax is replaced by sbr_ld_grid(), as defined in the following:

After 4.6.19, add a new subclause with the title "Enhanced Low Delay codec":

4.6.20 Enhanced Low Delay Codec

4.6.20.1 Introduction

The Enhanced Low Delay (AAC-ELD) coding scheme provides an extension of the low delay coding functionalities described in 4.6.17. The lowest algorithmic delay for this codec is 15ms. This codec allows the usage of the Low Delay SBR tool in order to achieve a low bitrate and low delay coding scheme for communication applications.

The ER AAC ELD codec is derived from the ER AAC LD codec, described in subclause 4.6.17 (ER AAC LD). In order to achieve a sufficiently low delay, especially in combination with low delay SBR, some modifications are necessary, e.g. Low Delay Window, as defined in the following:

4.6.20.2 Low Delay Window

The synthesis filterbank is modified in order to adopt a low-delay filterbank. The core IMDCT algorithm is mostly unchanged, but with a longer window such that n is now running up to 2N-1 (rather than up to N-1), see 4.6.11.3.1, 4.6.17.2.1 and 4.6.17.2.2.

$$x_{i,n} = -\frac{2}{N}\sum_{k=0}^{\frac{N}{2}-1} spec[i][k]\cos\left(\frac{2\pi}{N}(n+n_0)\left(k+\frac{1}{2}\right)\right) \quad for\ 0 \le n < 2N$$

where:

n = sample index
i = window index
k = spectral coefficient index
N = window length
n_0 = (-N / 2 + 1) / 2

with N = 960 or 1024.

The windowing and overlap-add is modified, compared to 4.6.11.3.2, 4.6.11.3.3, 4.6.17.2.3, in the following way:

The length N window is replaced by a length 2N window with more overlap in the past, and less overlap to the future (N/8 values are actually zero).

Windowing for the Low Delay Window:

$$z_{i,n} = w_{LD}(n) \cdot x_{i,n}$$

Where the window now has a length of 2N, hence n=0,…,2N-1, with coefficients listed in Table AMD9.15 for N=1024 and Table AMD9.16 for N=960.

Overlap and add:

$$out_{i,n} = z_{i,n} + z_{i-1,n+\frac{N}{2}} + z_{i-2,n+N} + z_{i-3,n+N+\frac{N}{2}}$$

for 0<=n<N/2

4.6.20.4 Decoding of ELDSpecificConfig

frameLengthFlag see GASpecificConfig() (subclause 4.5.1.1)

aacSectionDataResilienceFlag see GASpecificConfig() (subclause 4.5.1.1)

aacScalefactorDataResilienceFlag see GASpecificConfig() (subclause 4.5.1.1)

aacSpectralDataResilienceFlag see GASpecificConfig() (subclause 4.5.1.1)

ldSbrPresentFlag The ldSbrPresentFlag corresponds to the variable sbrPresentFlag used for non low delay SBR. The decoder has the same behaviour with respect to this flag.

ldSbrCrcFlag The variable ldSbrCrcFlag signals the CRC syntax for low delay SBR. The CRC calculation only includes the payload without any byte alignment bits.

ldSbrSamplingRate The ldSbrSamplingRate determines the sampling rate factor between core coder and SBR, where 0 stands for single rate and 1 for dual rate.

eldExtType A four bit code that identifies the extension type according to Table AMD9.14.

eldExtLen Length descriptor of eld extension configuration in bytes

eldExtLenAdd First additional length field of eld extension configuration in bytes

eldExtLenAddAdd Second additional length field of eld extension configuration in bytes

other_byte Helper variable for parsing over unknown configuration payload
